

AvailabilityGuard/DR™

Ensure Business Continuity & Disaster Recovery Readiness

Used by leading enterprises worldwide, AvailabilityGuard/DR is a unique IT Operations Analytics solution that provides visibility into your entire IT infrastructure and enables you to ensure your business continuity and disaster recovery readiness.

The Power of Prevention

AvailabilityGuard/DR serves as a common platform for all relevant IT teams to collaboratively validate changes and correct critical misconfigurations - even within the most complex and diverse environments.

This approach helps eliminate single-points-of-failure across your entire IT stack before they impact your business, avoiding expensive service disruptions and costly firefighting.

Proactive DR Risk Detection

The AvailabilityGuard Risk Detection Engine™ automatically scans your IT infrastructure in a non-intrusive, read-only mode. It collects up-to-date configuration information from servers and clusters, storage devices, virtual infrastructure, and database servers across physical, virtual, and hybrid environments.

Using predictive analytics, it pinpoints any single-points-of-failure or other misconfigurations that can lead to potential downtime and data loss and immediately alerts the relevant IT teams with the suggested resolution.

- » Early detection of DR risks and single-points-of-failure
- » Automated, cross-layer & vendor agnostic configuration validation
- » Actionable alerts with best practice resolutions
- » Measurement and visualization of RPO/RTO (IT analytics)

“Products such as Continuity Software definitely help shine light on the faults that keep critical recoveries from happening, well before a crisis ...”

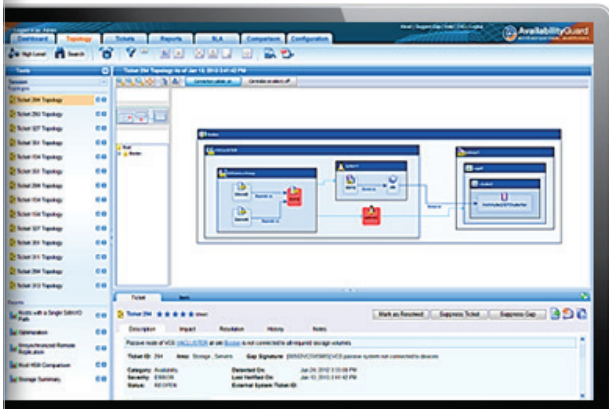

Bob Laliberte , Enterprise Strategy Group

The AvailabilityGuard Dashboard

The dashboard provides immediate visibility into availability and data loss risks as well as their potential impact on critical business services, allowing you to focus attention and resources on the most critical areas of your IT infrastructure.

- » Eliminate up to 90% of unplanned infrastructure outages
- » Achieve higher IT operations stability and configuration quality
- » Validate synchronization between production and replication
- » Point-in-time DR testing with continuous DR readiness
- » Increase cross-domain collaboration and resource productivity
- » Audit and measure BC/DR KPI's
- » Maximize your IT investments

AvailabilityGuard Action Tickets

AvailabilityGuard tickets include detailed issue description, the potential business impact, and a suggested best practice resolution to trigger immediate action and facilitate collaboration among the relevant IT teams.
